

Static Analysis

Gitleaks (<https://github.com/gitleaks/gitleaks>)

GitLeaks is an open-source tool crafted to detect inadvertent exposure of sensitive information within Git repositories. It meticulously scans codebases for potential secrets, such as API keys, passwords, and other confidential data. By promptly alerting developers to potential security vulnerabilities, GitLeaks empowers them to take corrective measures to fortify their repositories. According to GitHub's guidelines on safeguarding API credentials, developers are advised against pushing unencrypted authentication credentials, such as tokens or keys, to any repository, irrespective of its privacy settings. Instead, they are encouraged to leverage GitHub Actions secrets or Codespaces secrets for enhanced security measures (source: <https://docs.github.com/en/rest/authentication/keeping-your-api-credentials-secure?apiVersion=2022-11-28>).

Tip

To view a specific commit on GitHub, replace PROJECT with the project name and HASH with the commit's hash: <https://github.com/ITEversion/PROJECT/commit/HASH>

To view a specific commit using command line: `git show HASH -L START,END:FILENAME`

After conducting a Gitleaks scan on the code base and refining the results to eliminate false positives and duplicates, the following secrets were uncovered:

Countermeasures (only for reference purpose)

- Firebase API keys are generally not considered as secrets, but there might be situations where we need additional protection: <https://firebase.google.com/docs/projects/api-keys>
- Completely remove sensitive data from the Github repository ('s history): <https://docs.github.com/en/authentication/keeping-your-account-and-data-secure/removing-sensitive-data-from-a-repository>
- Use Github Actions secrets
- Use Codespaces secrets
